

## CUSTOMIZED DASHBOARDS TO TRACK GOALS AND TAKE ACTION

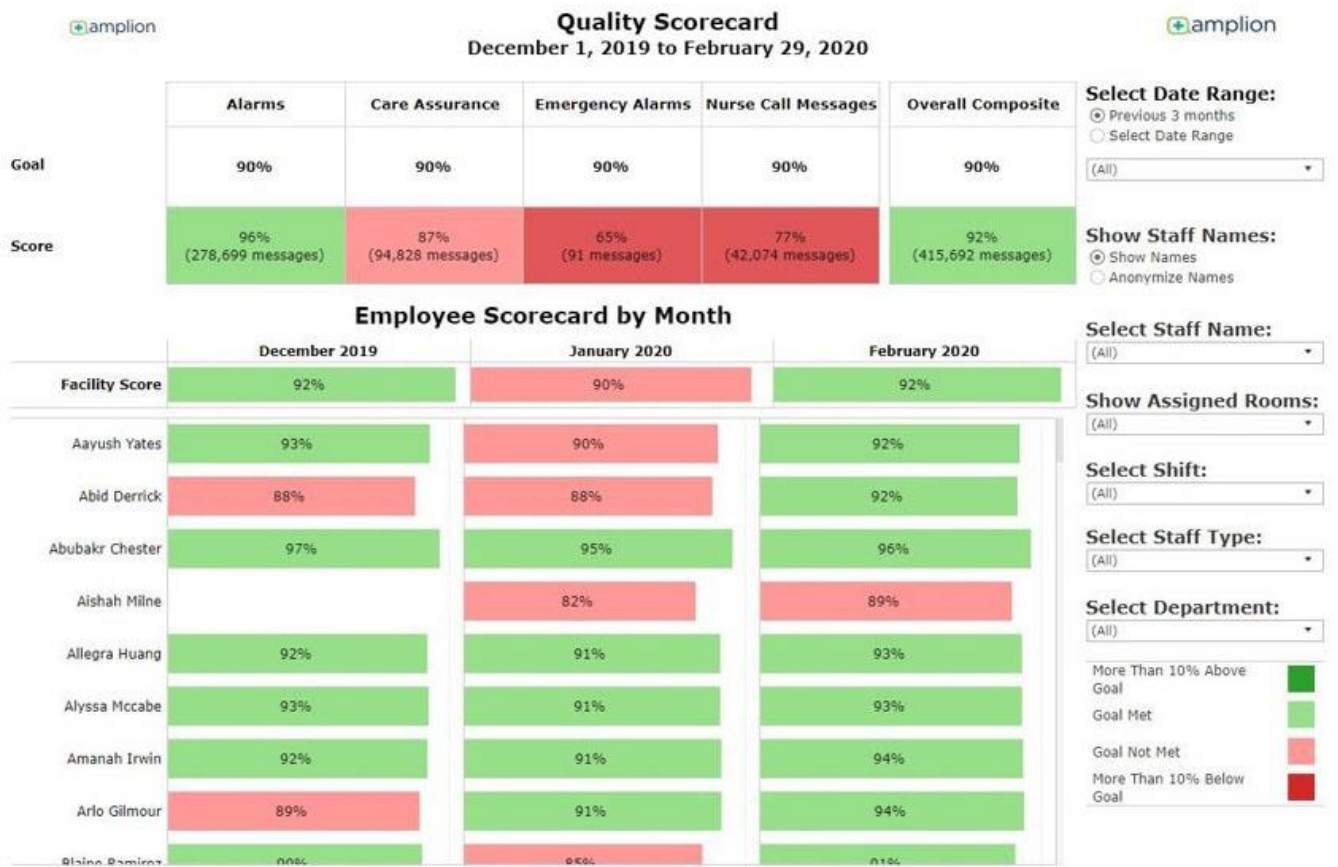

Amplion's Care Analysis reflective analytics engine provides objective data to quickly and easily diagnose issues and take action. Thousands of data points collected at the patient's bedside flow into a robust reporting portal that gives hospital leaders nearly real-time insight into point-of-care activity and staff performance.

Amplion's Care Analysis helps healthcare facilities adequately monitor performance, quantify patient demand, and leverage existing investments.

## MONITOR PERFORMANCE & ROUNDING COMPLIANCE

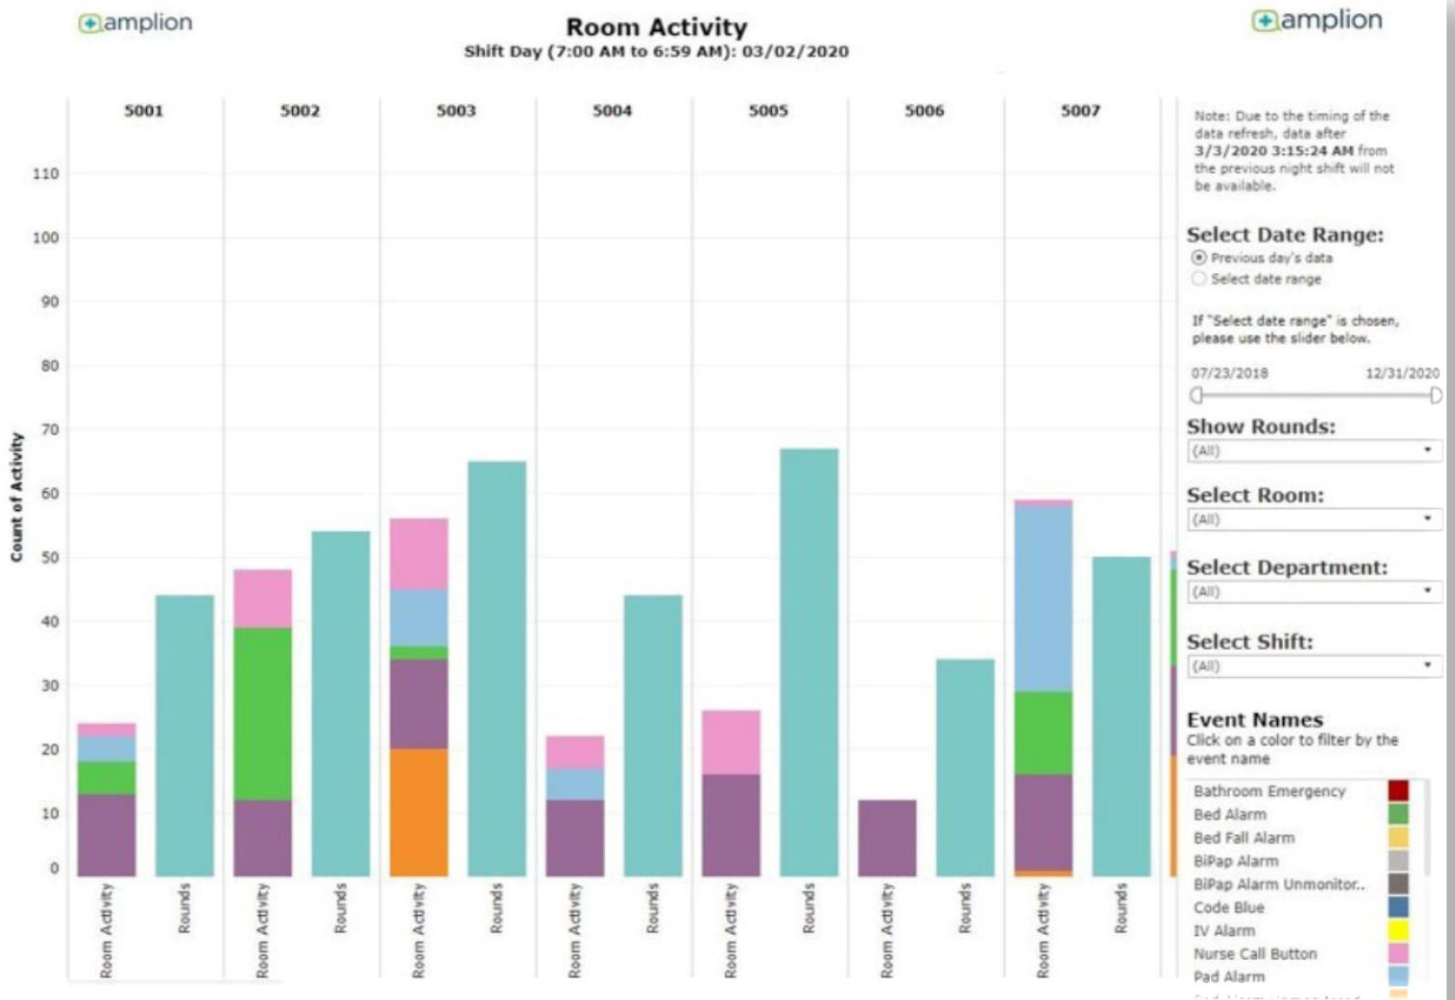

Quality Scorecard and Trend reports display compliance towards given goals at both the hospital and staff levels. Drill down to see performance metrics, see how response times are improving over time, and pinpoint opportunities for improvement and coaching.

Care Analysis can help your clinical teams positively impact patient satisfaction scores and reduce the administrative burden of paper charting. Using the Round Compliance report, you can quickly obtain data on overall unit performance against established goals and protocols such as phone use or rounds reminders.

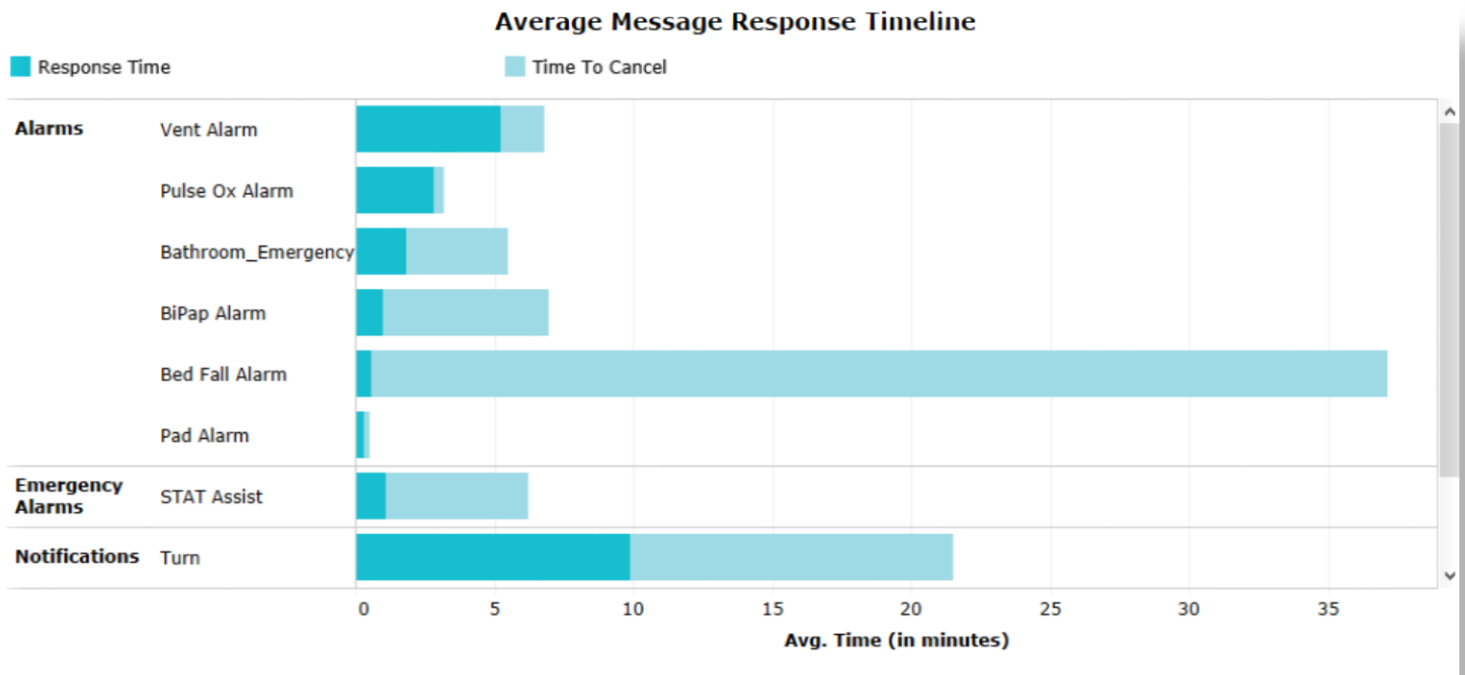

# QUANTIFY PATIENT DEMAND

The Room Activity report delivers data on the level of alarm and messaging activity by room. This report can be used to improve staff workflow and workload by providing evidence of patient demand in each room. Clinical managers can quickly identify opportunities for leadership rounding and mitigating staff burnout.

## LEVERAGE EXISTING INVESTMENTS

Healthcare providers continue to face ever-increasing financial and cost pressures. Leveraging existing systems and investing in interoperable technology which can break down data silos is key. Amplion Care Analysis has been designed to do just that. The Care Analysis engine is compatible with legacy nurse call systems, real-time locating systems, and modern EMR systems.
